

AD User Creation Tool – Testing Notes

Version Tested: 1.1

The application has the following main functionality features:

- Single User Creation Mode
- CSV Mode for bulk account creation from a CSV file
- Create CSV Template CSV file to use with 'CSV Mode'

The 'ANUC.options.xml' file is also used to store configurable XML options for Single User Creation Mode.

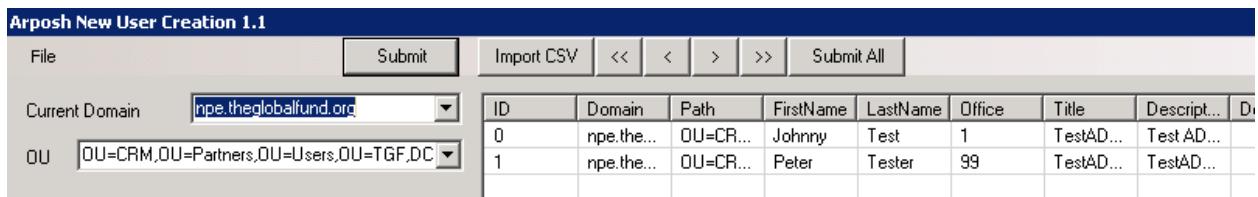

Known issues with CSV Mode

In CSV Mode; the application is meant to ignore the options of Single Mode and the 'ANUC.options.xml' file. When attempting to Submit accounts to be created in this mode; you often encounter an exception related to the -Path parameter in the New-ADUser PowerShell commandlet:

New-ADUser : Cannot validate argument on parameter 'Path'. The argument is null or empty. Supply an argument that is not null or empty and then try the command again.

As a workaround; manually entering the details in for this into the fields in the tool appear to fix this like the example below:

Current Domain
OU

Sometimes having these entered into the 'ANUC.options.xml' file on first run also resolved it.

```
<Domain></Domain>
```

```
<Path></Path>
```
